

Plug-In Hybrid Modeling and Application: Cost / Benefit Analysis

*Presented at the 3rd AVL Summer Conference on Automotive Simulation Technology:
Modeling of Advanced Powertrain Systems*

Andrew Simpson
National Renewable Energy Laboratory

Thursday, 24th August 2006
Dearborn, Michigan

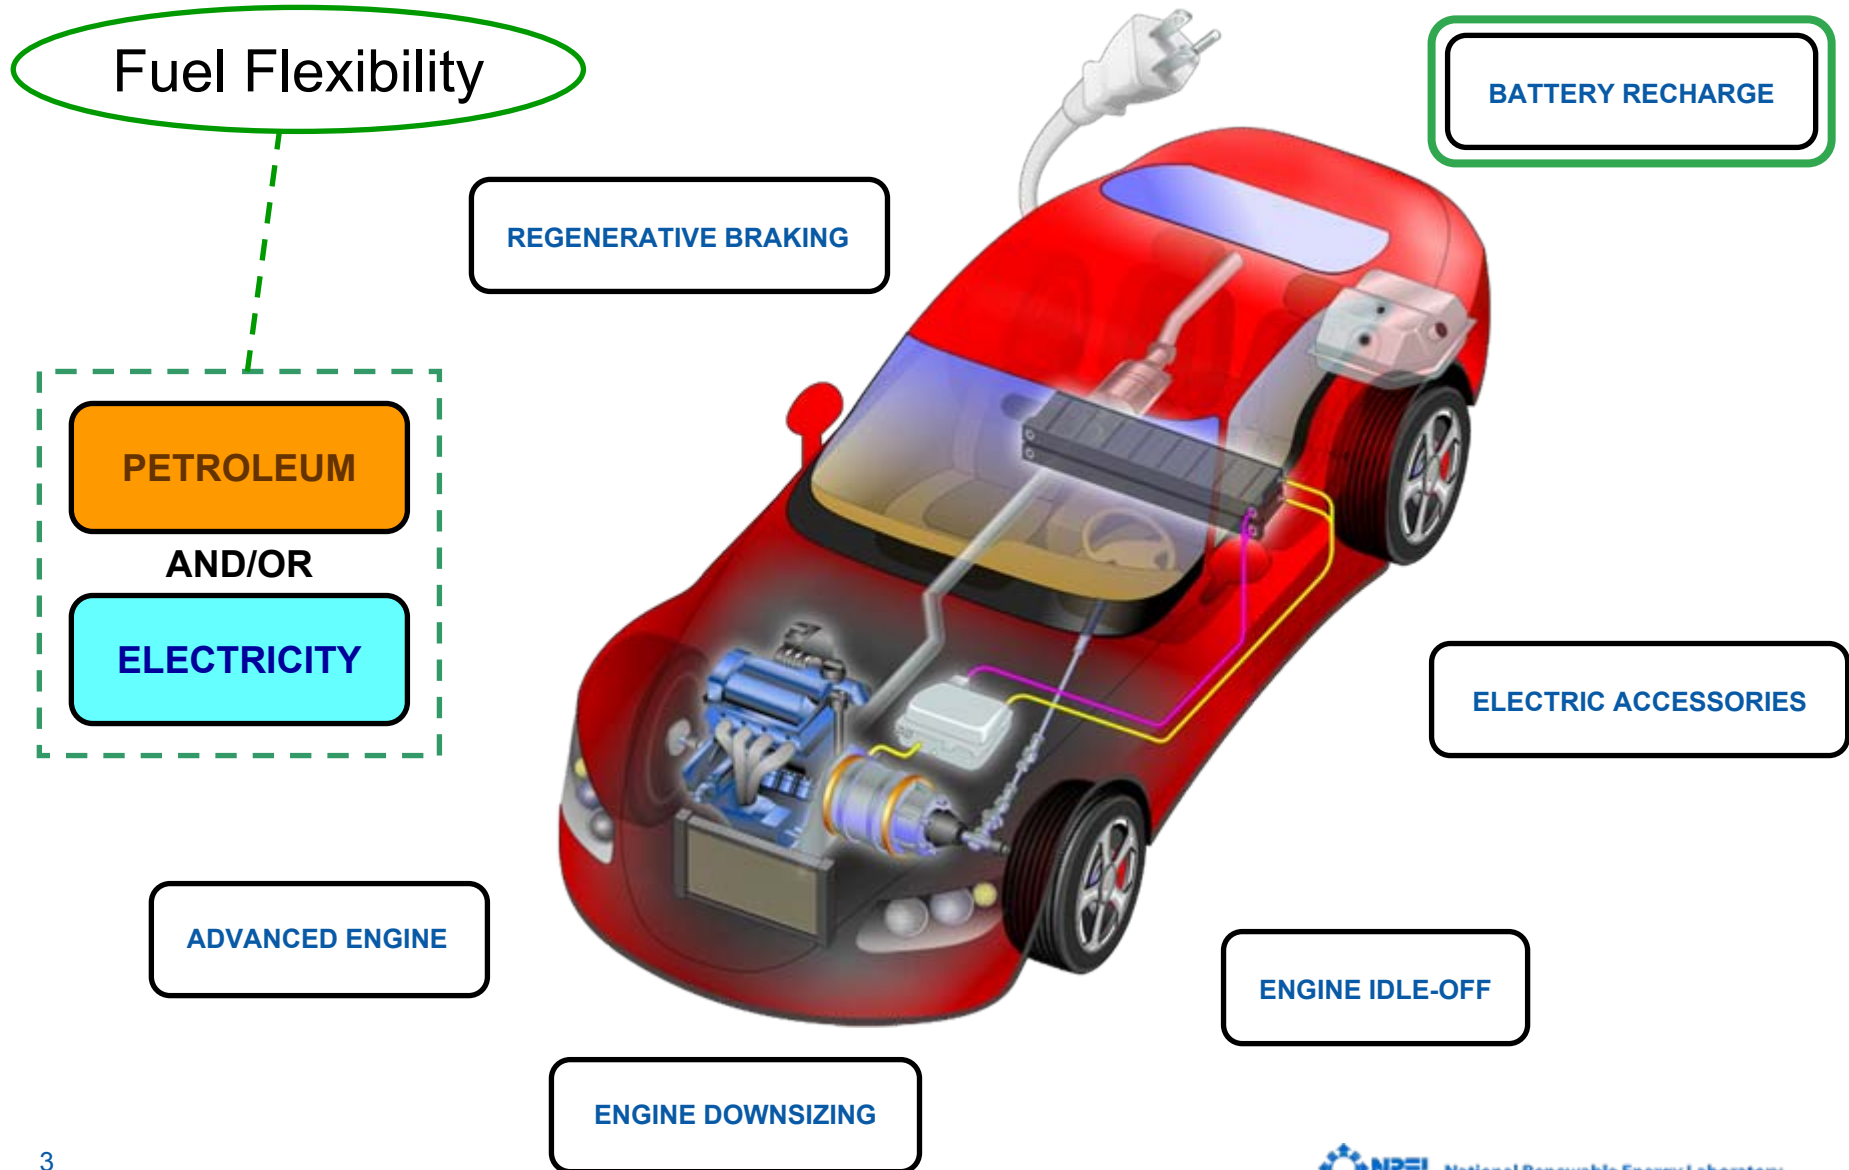

With support from the
U.S. Department of Energy
Office of Energy Efficiency and Renewable Energy
FreedomCAR and Vehicle Technologies Program

Presentation Outline

- What is a plug-in hybrid-electric vehicle (PHEV)?
- Potential petroleum reduction from PHEVs
- Simulation of PHEV efficiency and cost
 - Baseline vehicle assumptions
 - Powertrain technology scenarios
 - Components models (cost, mass, efficiency)
- Results
 - Component sizing
 - Fuel Economy
 - Incremental cost
 - Payback scenarios
- Conclusions & Next Steps

A Plug-In Hybrid-Electric Vehicle (PHEV)

Some PHEV Definitions

All-Electric Range (AER): After a full recharge, the total miles driven electrically (engine-off) before the engine turns on for the first time.

Blended Mode: A *charge-depleting* operating mode in which the engine is used to supplement battery/motor power.

PHEV20: A PHEV with useable energy storage equivalent to 20 miles of driving energy on a reference driving cycle.

NOTE: PHEV20 does not imply that the vehicle will achieve 20 miles of AER on the reference cycle nor any other driving cycle. Operating characteristics depend on the power ratings of components, the powertrain control strategy and the nature of the driving cycle

PHEV Key Benefits and Challenges

KEY BENEFITS

Consumer:

- Lower “fuel” costs
- Fewer fill-ups
- Home recharging convenience
- Fuel flexibility

Nation:

- Less petroleum use
- Less greenhouse and regulated emissions
- Energy diversity/security

KEY CHALLENGES

- Recharging locations
- Battery life ?
- Component packaging
- Vehicle cost

Cost-Benefit Analysis

National Driving Statistics: 1995 National Personal Transportation Survey

Potential Petroleum Reduction from PHEVs

PHEV Efficiency and Cost Model

Vehicle Configurations

- conventional automatic
- pre-transmission parallel hybrid: HEV or PHEV
- 2 technology scenarios
 - near term and long term

Approach

- Dynamic, power-flow simulation
- Calculates component sizes and costs
- Iterative mass-compounding
- Measures fuel/electricity consumption using NREL-proposed revisions to SAE J1711
- *Battery definition is key input to the simulation*

Baseline Vehicle Characteristics – Midsize Sedan

MIDSIZE SEDAN (AUTOMATIC)	
Platform Parameters	
Glider Mass	905 kg
Curb Mass	1429 kg
Test Mass	1565 kg (136 kg load)
Gross Vehicle Mass (GVM)	1899 (470 kg load)
Drag coefficient	0.30
Frontal area	2.27m ²
Rolling resistance coefficient	0.009
Baseline accessory load	800 W elec. + 2900 W A/C
Performance Parameters	
Standing acceleration	0-60 mph in 8.0 s
Passing acceleration	40-60 mph in 5.3 s
Top speed	110 mph
Gradeability	6.5% at 55 mph at GVM with 2/3 fuel converter power
Vehicle attributes	
Engine power	121 kW
Fuel economy	22.2 / 35.2 / 26.6 mpg (urban / highway / composite, unadjusted)

Powertrain Technology Scenarios

Battery	Near-Term Scenario	Long-Term Scenario
Chemistry	NiMH	Li-Ion
Module cost	Double EPRI projections, see slide 12	EPRI projections, see slide 12
Packaging cost	EPRI	Same
Module mass	NiMH battery design function (Delucchi), see slide 12	Li-Ion battery design function (Delucchi), see slide 12
Packaging mass	Delucchi	Same
Efficiency	Scaleable model based on P/E ratio	Same
SOC window	SOC design curve based on JCI data for NiMH cycle-life, see slide 11	Same (assumes Li-Ion achieves same cycle life as NiMH)

Motor	Near-Term Scenario	Long-Term Scenario
Mass	DOE 2006 current status	Based on GM Precept motor drive
Efficiency	95% peak efficiency curve	Same
Cost	EPRI (near term)	EPRI (long term)

Engine	Near-Term Scenario	Long-Term Scenario
Mass	Based on MY2003 production engines	Same*
Efficiency	35% peak efficiency curve	Same*
Cost	EPRI	Same*

* Engine technologies were not improved so as to isolate the benefits of improved plug-in hybrid technology

Battery Definition as Key Input to Simulation

Input parameters that define the battery in BLUE

DOH = degree of hybridization

Battery SOC Design Window

Battery SOC design curve for 15 year cycle life

Battery Models (Scaleable)

Battery Design Functions

Battery Cost Functions

Results: Battery Specifications

Results: Battery Specifications

Reduction in Fuel Consumption vs Powertrain Cost Increment - Midsize Sedans

PHEV Energy Use

PHEV Onboard Energy Use: Near and Long-Term Scenarios

Powertrain Costs Comparison – Near Term

Powertrain Costs (incl. retail markups)

Powertrain Costs Comparison – Long Term

Powertrain Costs (incl. retail markups)

Overall Cost Comparison for HEVs and PHEVs

Cumulative Vehicle plus Energy (Fuel/Elec.) Costs

Overall Cost Comparison for HEVs and PHEVs

Cumulative Vehicle plus Energy (Fuel/Elec.) Costs

Overall Cost Comparison for HEVs and PHEVs

Cumulative Vehicle plus Energy (Fuel/Elec.) Costs

Why might PHEV buyers pay more?

1. Tax incentives
2. Reduced petroleum use, air pollution and CO₂
3. National energy security
4. Less maintenance
5. Reduced fill-ups
6. Convenience of home recharging (off-peak)
7. Improved acceleration (high torque of electric motors)
8. Green image, “feel-good factor”
9. Backup power
10. Vehicle-to-grid (V2G)

1. There is a very broad spectrum of HEV-PHEV designs.
2. **Key factors** in the HEV/PHEV cost-benefit equation include:
 - Battery costs
 - Fuel costs
 - Control strategy (particularly battery SOC window)
 - Driving habits (annual VMT and trip-length distribution)
3. Based on the assumptions of this study:
 - HEVs can reduce per-vehicle fuel use by approx. 30%.
 - PHEVs can reduce per-vehicle fuel use by up to 50% for PHEV20s and 65% for PHEV40s.
 - In the long term, powertrain cost increments are predicted to be \$2-6k for HEVs, \$7-11k for PHEV20s and \$11-15k for PHEV40s assuming that projected component (battery) costs can be achieved.
 - Note this study did not consider benefits from platform engineering (i.e. mass/drag reduction).

Conclusions (cont.)

4. Based on overall costs (powertrain plus energy):
 - At today's fuel and powertrain component costs, conventional vehicles are the most cost-competitive.
 - HEVs become the most cost-competitive EITHER if fuel prices increase OR projected battery costs are achieved.
 - PHEVs become cost-competitive ONLY if projected battery costs are achieved AND fuel prices increase.
 - Tax incentives and/or alternative business models (e.g. battery lease) may be required for successful marketing of PHEVs

- Present this work at EVS22
- Expand the HEV-PHEV analysis space to include:
 - Platform engineering (mass/drag reduction)
 - Different performance constraints / component sizes

SAE 2007 paper
- Detailed simulation of promising PHEV designs:
 - Real world driving patterns (e.g. St Louis data)
 - Control strategy optimization

TRB 2007 paper
- Optimization of PHEV market competitiveness using Technical Targets Tool

Ongoing analysis
